PROFESSIONAL SUMMARY

Full-Stack Software Engineer with 5+ years of experience designing, modernizing, and delivering enterprise software, with strong foundations in Java, Spring Boot, distributed backend systems, Angular, and TypeScript. Experienced in technical ownership, enterprise application modernization, frontend architecture, asynchronous messaging, CI/CD, and production troubleshooting. Previously led a four-engineer team while remaining hands-on in development, and currently owns key frontend and device-onboarding capabilities within OPSWAT cybersecurity products.

CORE TECHNICAL SKILLS

Backend: Java, Spring Boot, REST APIs, gRPC, Go, NestJS

Frontend: TypeScript, JavaScript, Angular, React, Electron, HTML, CSS

Distributed Systems & Messaging: RabbitMQ, Kafka Streams, Amazon SQS, Redis, Server-Sent Events

Databases & Search: PostgreSQL, MongoDB, Oracle, MySQL, Elasticsearch

Security & Identity: JWT, OAuth 2.0, Keycloak, Azure Entra, Firebase Authentication

DevOps & Cloud: Docker, Jenkins, TeamCity, CI/CD, Nginx, Azure Key Vault, Azure Functions, Vercel

PROFESSIONAL EXPERIENCE

OPSWAT Vietnam

May 2023 - Present

Full-Stack Engineer II | Cybersecurity

MetaDefender Kiosk | *Angular, TypeScript, Electron, gRPC, MongoDB, Azure Entra, TeamCity, Jenkins*

- Modernized a legacy web console from Angular 2 to Angular 17, addressing outdated dependencies, maintainability limitations, and CVE exposure while enabling new product development.
- Implemented a micro-frontend architecture spanning 8 applications, improving modularity and shared-component reuse while establishing a foundation for future module- and plugin-based extensibility.
- Architected and implemented the complete client-side Out-of-Box Experience (OOBE) for MetaDefender Kiosk hardened images across K1, K2, and K3 devices.
- Owned the OOBE frontend end-to-end, including Electron architecture, Angular implementation from Figma mockups, and gRPC integration with backend services.
- Standardized a previously multi-step, customer-specific onboarding process into one workflow, reducing device setup from up to approximately 1 hour to a maximum of around 30 minutes before normal scanning operations.
- Designed the OOBE architecture for future configuration-driven auto deployment, reducing reliance on manual setup and enabling a one-click end-to-end onboarding direction.
- Regularly reviewed PRs and code, mentored 3 team members, assigned technical tasks, and supported architectural and implementation decisions.
- Built internal productivity tools and an AI-assisted Jenkins pipeline that analyzes Jira development tickets and supports implementation workflows.

MetaAccess - MetaDefender Endpoint | *Java, Spring Boot, MongoDB, RabbitMQ, Amazon SQS, Redis, Elasticsearch*

- Contributed to backend development for cloud and on-premises deployments using Spring Boot and distributed infrastructure components.
- Designed and implemented an asynchronous email notification capability using RabbitMQ, and investigated defects across backend services and web-console components.

**Bosch Global Software Technologies
Vietnam**

Nov 2021 - May 2023

Project Lead / Full-Stack Engineer

Patent Study - Internal Enterprise Patent Management Platform | *Java 11, Spring Boot, Angular, Oracle, JPA, JWT, Jenkins*

- Led a team of 4 engineers while remaining approximately 50% hands-on in development, combining technical leadership with direct implementation.
- Held primary technical ownership of the modernization initiative, including technology selection, framework choices, application architecture, engineering conventions, and implementation direction.
- Redesigned a legacy Spring MVC application into a three-tier architecture using Spring Boot and Angular; upgraded the backend from Java 7 to Java 11.
- Decoupled the frontend from server-rendered backend resources, refactoring controllers into REST-oriented Spring Boot services and rebuilding the UI as a standalone component-based Angular application.
- Modernized authentication to a JWT-based security model and refactored the Oracle/JPA persistence layer for the new Spring Boot architecture.
- Refactored substantial legacy code, removed redundant and unused implementation, and improved responsiveness of data-heavy APIs, page loading, animations, and legacy UI/UX behavior.
- Delivered new product functionality including Power BI reporting integration.
- Assigned tasks, reviewed code, mentored engineers, resolved blockers, and worked directly in English with the Bosch India stakeholder through daily requirement and technical discussions, including a 3-month onsite collaboration period in Vietnam.
- Received a Bosch Spot Award from the India customer for contributions to application performance improvements.

FPT Software

May 2020 - Oct 2021

Backend Engineer

UnifiedPost | *Java, Spring Boot, PostgreSQL, Keycloak, Redis, Maven*

- Developed Spring Boot backend services and REST APIs for an enterprise console used to monitor and administer platform APIs, including user management, quota configuration, and administrative capabilities.
- Implemented authentication and authorization using OAuth 2.0 and Keycloak, and documented APIs with Swagger/OpenAPI.

R2Integration | *Java, Adobe Experience Manager, Servlets, Docker*

- Developed custom AEM components, OSGi services, Sling Models, REST APIs, and Java Servlets for enterprise content-management applications.
- Implemented AEM workflows and event listeners to automate content approval, asset processing, and publishing workflows.

SELECTED PROJECTS

System Monitor | *Spring Boot, Kafka Streams, NestJS, Docker Compose, Jenkins, SSE, Azure, Firebase*

- Designed and deployed a distributed monitoring platform for tracking system health and Kafka service availability on self-hosted infrastructure, with real-time event processing via Kafka Streams and live updates via Server-Sent Events.
- Containerized services and implemented Jenkins CI/CD pipelines; integrated Azure Key Vault, Firebase Authentication, and Azure Functions.

AI Trip Planner | *React, Gemini API, Docker, Nginx, Jenkins, Cloudflare Tunnel*

- Built and deployed an AI-powered travel planning application using React and the Gemini API, containerized with Docker and automated through Jenkins pipelines and Git webhooks.

EDUCATION

Bachelor of Computer Engineering | International University - Vietnam National University, Ho Chi Minh City | 2020

Major: Computer Science and Engineering

RECOGNITION

Best Employee - Q1 2025, OPSWAT - Recognized for contributions to a Windows-based device onboarding application.
